### Research Summary

Oral Guided Bone Regeneration (GBR) membrane is a specialized medical device used in oral and maxillofacial surgery and implant dentistry. It plays a critical role in regenerating bone tissue in the oral cavity, particularly when there is bone loss due to periodontal disease, trauma, or tooth extraction. The GBR membrane is typically made from biocompatible materials, such as resorbable or non-resorbable membranes, and it is surgically placed in the area where bone regeneration is required. This membrane acts as a barrier, preventing soft tissue (like gums) from invading the healing site while allowing space for new bone to form. Over time, the GBR membrane can be resorbed or removed, leaving behind newly regenerated bone, which is essential for supporting dental implants, restoring lost teeth, or improving overall oral health. GBR is a valuable technique that enhances the success of various dental and periodontal procedures by promoting the regeneration of lost or damaged bone tissue in the oral cavity.

The major global manufacturers of Oral Guided Bone Regeneration (GTR) Membrane
