### Research Summary

An Oral Implant Surgery Navigation System is a state-of-the-art technology used in implant dentistry to precisely plan and guide the placement of dental implants in a patient's jaw. It combines 3D imaging, computer software, and real-time surgical guidance to enhance the accuracy and safety of implant surgeries. Before the procedure, a CBCT scan (Cone Beam Computed Tomography) is taken to create a detailed 3D map of the patient's oral anatomy. Using this information, the system generates a virtual treatment plan, allowing the dentist or oral surgeon to plan the exact implant location and angle. During the surgery, the system provides real-time guidance, tracking the position of surgical instruments and the patient's head, ensuring that the implants are placed with precision according to the pre-planned specifications. This technology improves the success rate of dental implant procedures, minimizes the risk of complications, and shortens the overall treatment time for patients.
