Research Summary

An orthodontic bracket is a small attachment used in orthodontic treatment to hold and guide the archwire in proper alignment to correct tooth misalignment and malocclusions. These brackets are typically made of stainless steel or ceramic materials and are bonded to the front surface of the teeth using orthodontic adhesive. Orthodontic brackets come in different shapes and sizes to accommodate various tooth types and treatment needs. They have a small slot or groove where the archwire is threaded through and secured with ligatures or elastic ties. The archwire, in combination with the brackets, exerts gentle pressure on the teeth, gradually moving them into the desired position over time. Orthodontic brackets play a crucial role in orthodontic treatment, aiding in the precise control and adjustment of tooth movement to achieve proper alignment and improve the overall function and aesthetics of the patient's smile.
