Research Summary

Parachutes are a type of aerodynamic device designed to slow down the descent of an object or person through the atmosphere, primarily by increasing air resistance. They consist of a canopy made of lightweight, strong fabric with a specific shape that allows it to capture air as it descends. Parachutes are used for a variety of purposes, including recreational skydiving, military operations, rescue missions, and as safety devices for astronauts during space re-entry. When deployed, a parachute slows the fall of the attached object or individual, reducing the speed and impact force upon landing, ultimately ensuring a safer descent. Different types of parachutes, such as round and square canopies, are used for specific applications depending on the desired descent characteristics.

The major global manufacturers of Parachutes include IrvinGQ, Zodiac Aerospace, AVIC, China Aerospace Science and Technology Corporation, BRS Aerospace, Fujikura Parachute, Performance Designs, VITAL Parachute, Mills Manufacturing, Vertical do Ponto, Complete Parachute, FXC Corporation, etc. The global players
