Research Summary

A peak flow meter is a handheld medical device used to measure a person's peak expiratory flow (PEF), which is the maximum speed at which they can exhale air from their lungs. This device is primarily employed in the management of respiratory conditions, such as asthma, to monitor lung function and assess the severity of airway constriction. To use a peak flow meter, an individual takes a deep breath and then exhales forcefully into the device. The peak flow meter records the PEF, providing a numerical value that reflects the strength of the individual's breath and the condition of their airways. By tracking PEF measurements over time, healthcare professionals and patients can gain valuable insights into the effectiveness of asthma management and adjust treatment plans accordingly, helping to improve respiratory health and control asthma symptoms.
