Research Summary

Pediatric cranial orthosis, commonly referred to as a cranial helmet, is a medical device used to treat deformational plagiocephaly, a condition where a baby's skull develops an abnormal shape due to external pressure. The orthosis is custom-fitted to the child's head and designed to gently redirect skull growth, allowing the head to develop into a more symmetrical shape as the child grows. Made from lightweight, durable materials such as plastic and foam, the cranial orthosis works by applying even pressure to areas of the skull while leaving space for growth in the flattened or misshapen areas. Typically worn for several months, the helmet is adjusted over time to accommodate the child's head growth. Pediatric cranial orthoses are non-invasive and are primarily used in infants with mild to moderate cranial deformities, helping to improve the aesthetic appearance and reduce potential long-term effects such as facial asymmetry.

The major global manufacturers of Pediatric Cranial Orthosis include Cranial Technologies, Boston Orthotics & Prosthetics, Orthomerica Products, BioSculptor, Japan Medical Company, Invent Medical, TalentLand, etc. The global players
