Research Summary

Phase-shifting transformers (PSTs) are specialized power transformers used in electrical power transmission systems to control the phase angle of the voltage transmitted through different transmission lines. These transformers enable the adjustment of the relative phase displacement between the primary and secondary sides, allowing for the control of power flow and optimization of the network's performance. PSTs are particularly useful in power systems with interconnected grids, where controlling the phase angle helps manage the power flow, voltage stability, and system reliability. By dynamically adjusting the phase shift, these transformers contribute to balancing loads and optimizing the utilization of transmission assets. They play a crucial role in enhancing the flexibility and efficiency of power transmission networks.

The major global manufacturers of Phase Shifting Transformers include Siemens, ABB, Toshiba, Raychem RPG, SGB_SMIT, CG, Tamini, Baoding Tianwei Baobian Electric, etc. The global players competition landscape in this report is divided into three tiers.
