Research Summary

A phased array antenna is a type of antenna system used in radar, communication, and other wireless applications. Unlike traditional antennas with a single directional beam, phased array antennas consist of an array of individual antenna elements that can be controlled independently. By adjusting the phase and amplitude of the signals applied to each element, the antenna can electronically steer the direction of the radiated or received beam without physically moving the entire structure. This electronic beam steering capability allows for rapid and precise control of the antenna's coverage, enabling features such as beam scanning, tracking, and the ability to form multiple beams simultaneously. Phased array antennas offer enhanced flexibility, agility, and responsiveness, making them valuable in various applications, including military radar systems, satellite communication, and 5G wireless networks.

The major global manufacturers of Phased Array Antenna include SpaceX, Boeing, Kymeta, Lockheed Martin, Raytheon Technologies, Intellian Technologies, Cobham Aerospace Communications, Chengdu T-Ray Technology, Chengdu Ruidi Wei
