Research Summary

A phoropter is a specialized optical device used by eye care professionals, particularly optometrists and ophthalmologists, to determine an individual's refractive error and prescribe corrective lenses. It consists of a series of lenses and prisms that can be adjusted to present different combinations of optical powers to the patient. During an eye examination, the patient looks through the phoropter at an eye chart, and the eye care professional systematically changes the lenses to find the combination that provides the clearest vision. This process helps determine the appropriate prescription for glasses or contact lenses. Phoropters are a fundamental tool in the refraction process, allowing eye care professionals to assess and address issues such as nearsightedness, farsightedness, astigmatism, and presbyopia.
