Research Summary

Phosphazene flame retardants are a class of chemical compounds containing phosphorus and nitrogen in a cyclic or polymeric structure. These flame retardants are widely used in various industries to improve the fire resistance of materials such as plastics, textiles, and foams. Phosphazene flame retardants work by releasing phosphorus-containing gases when exposed to high temperatures, forming a protective char layer that inhibits the combustion process. This mechanism reduces the flammability and slows down the spread of fire, making materials treated with phosphazene flame retardants more fire-resistant. These flame retardants are valued for their effectiveness, low toxicity, and environmental compatibility compared to some traditional halogen-based flame retardants. As a result, phosphazene flame retardants contribute to enhancing the fire safety of a wide range of products, including electronics, construction materials, and transportation components.

The major global manufacturers of Phosphazene Flame Retardant include Otsuka Chemical, Weihai Jinwei ChemIndustry, FUSHIMI Pharmaceutical, Benxi G-CHEM,
