Research Summary

Phosphorescent pigments are luminescent materials that absorb and store energy from light sources and then emit a visible glow in the dark after the light source is removed. Unlike fluorescent pigments that release light immediately, phosphorescent pigments have a delayed emission, creating a prolonged afterglow effect. These pigments typically contain phosphors, which are substances capable of storing and re-emitting light energy. Commonly used phosphorescent materials include zinc sulfide and strontium aluminate. Phosphorescent pigments find applications in a variety of products such as glow-in-the-dark paints, signage, toys, and safety markings. Their ability to provide visibility in low-light conditions without an external power source makes them valuable in safety and novelty applications. Advances in phosphorescent technology have led to longer-lasting and brighter glow effects, contributing to their widespread use in both practical and decorative contexts.

The major global manufacturers of Phosphorescent Pigments include DayGlo, Nemoto Lumi-Materials Company, AllureGlow, ORCO, Iridron, Luming Technology Group, Ji'nan

Xinyue, Shiyatu, Zhongbang, Lightleader, Yeming Science & Technology, Hali Industrial, Jiaying Caihe, etc. The global players competition landscape in this report is divided into three tiers.
