Research Summary

Photocatalytic coatings refer to thin layers of materials, often containing photocatalysts like titanium dioxide, applied to surfaces such as glass, concrete, or metal. These coatings harness the principles of photocatalysis, wherein exposure to light activates chemical reactions on the coated surface. The photocatalytic process involves the generation of reactive oxygen species when the coating interacts with light, leading to the breakdown of organic pollutants and the self-cleaning of surfaces. This technology is widely used in architectural applications, where photocatalytic coatings on buildings can help purify the air by degrading pollutants and preventing the accumulation of dirt and organic matter. Additionally, photocatalytic coatings find applications in anti-fogging treatments, antimicrobial surfaces, and environmental remediation efforts, showcasing their potential to contribute to sustainability and improved cleanliness in various industries.

The major global manufacturers of Photocatalytic Coatings include TOTO, Kon, Mitsubishi Chemical, Sto, Advanced Materials, Saint-Gobain, PReTi, PPG, Green

Earth Nano Science, Eco Active Solutions, Zhejiang Hexie Photocatalytic, etc. The global players competition landscape in this report is divided into three tiers.
