Research Summary

A photomask pellicle is a thin, transparent protective membrane placed over a photomask used in photolithography processes, primarily in semiconductor manufacturing. Its main function is to protect the photomask from contamination, such as dust or particles, which could otherwise degrade the accuracy and quality of the pattern transfer onto the semiconductor wafer. The pellicle is typically made from materials like silica or polymer films, and it is mounted at a slight distance from the photomask to prevent the debris from coming into direct contact with the mask surface. By maintaining the cleanliness of the photomask, the pellicle ensures the fidelity of the photolithography process, which is critical for producing high-precision semiconductor devices.

The major global manufacturers of Photomask Pellicle include Mitsui Chemicals, Shin-Etsu, FINE SEMITECH, Micro Lithography Inc (MLI), S&S Tech, INKO Industrial, NEPCO, Canatu, etc. The global players competition landscape in this report is divided into three tiers.
