Research Summary

Photon-counting computed tomography (CT) is an advanced imaging technology that employs detectors capable of counting individual X-ray photons. Unlike traditional energy-integrating detectors, photon-counting detectors can distinguish between different energy levels of X-ray photons, offering enhanced spectral imaging capabilities. This allows for improved tissue contrast and material discrimination in CT scans. Photon-counting CT systems are designed to provide high-resolution images with reduced radiation dose, making them particularly valuable in medical imaging. The technology is still evolving, and ongoing research aims to optimize photon-counting CT for broader clinical applications, such as cardiovascular imaging and cancer detection, while addressing challenges like detector performance and image reconstruction techniques.

The major global manufacturers of Photon-counting Computed Tomography include Siemens Healthineers, GE Healthcare, Philips, NeuroLogica, United-imaging, Canon,
