Research Summary

A photovoltaic tracking bracket is a mechanical structure designed to support solar panels and enable their movement, adjusting the tilt and orientation to track the sun's path throughout the day. By following the sun's trajectory, photovoltaic tracking brackets optimize the incident angle of sunlight on solar panels, maximizing their energy capture and improving overall system efficiency. There are two main types of tracking systems: single-axis, which rotates the panels around one axis to follow the sun's east-to-west motion, and dual-axis, which adds another rotation to account for changes in the sun's elevation throughout the day. While tracking systems enhance energy yield, they also introduce complexities and costs compared to fixed-tilt installations. Photovoltaic tracking brackets are employed in solar power plants and other installations where maximizing energy production is a priority, helping to harness solar energy more efficiently by adapting to the sun's changing position in the sky.

The major global manufacturers of Photovoltaic Tracking Bracket include NEXTracker, GSC, FTC, Arctech Solar, Huge Energy, Schletter Solar, Unirac, Clenergy, Akcome, K2
