Research Summary

A PIN photodiode is a type of photodetector that operates based on the internal structure of the diode. The term "PIN" refers to the three layers in the diode: P-type (positive), Intrinsic (undoped or intrinsic semiconductor), and N-type (negative). The intrinsic layer is usually wider than in a standard photodiode, allowing for a larger absorption area. When photons strike the intrinsic layer, they create electron-hole pairs, generating a photocurrent. The PIN photodiode is particularly sensitive to light and is commonly used in applications such as optical communication systems, photovoltaic devices, and various sensing applications where accurate detection of light signals is essential. The PIN configuration enhances the diode's performance by reducing capacitance, enabling faster response times and improved sensitivity, making it suitable for a range of optoelectronic applications.

The major global manufacturers of PIN Photo Diode include Osram, Hamamatsu, Kodenshi, Lumentum, First Sensor, Vishay, Everlight, Kyosemi Corporation, ON Semiconductor, Luna Optoelectronic, etc. The global players competition landscape in
