Research Summary

Pipettes and pipettors are essential laboratory tools used for accurate and precise measurement and transfer of liquids in scientific and medical research, diagnostics, and various laboratory applications. Pipettes are handheld devices that dispense precise volumes of liquid, typically ranging from microliters to milliliters. They consist of a slender tube with a tapered tip and a piston or plunger mechanism that allows for controlled aspiration and dispensing of the liquid. Pipettors, on the other hand, are automated or semi-automated versions of pipettes that feature electronic or mechanical systems for dispensing precise volumes of liquid with minimal manual effort. They offer features such as adjustable volume settings, ergonomic designs, and programmable functions for increased efficiency and reproducibility in laboratory tasks. Pipettes and pipettors come in various types and formats, including air-displacement pipettes, positive-displacement pipettes, multichannel pipettes, and electronic pipettors, each suited for specific applications and volume ranges. These tools are critical for conducting experiments, preparing samples, performing assays, and ensuring accurate and reliable results in laboratory settings.
