Research Summary

Plasma Enhanced Chemical Vapor Deposition (PECVD) systems are advanced thin-film deposition tools used in materials science and semiconductor manufacturing. These systems employ plasma technology to enhance the chemical vapor deposition process. During PECVD, a precursor gas is introduced into a vacuum chamber, and a plasma is generated to break down the gas molecules into reactive species. These species then react on the substrate surface, forming a thin film with desired properties. PECVD is widely used for depositing materials like silicon dioxide, silicon nitride, and amorphous silicon, crucial in the production of microelectronics, solar cells, and other semiconductor devices. PECVD systems offer precise control over film thickness, composition, and uniformity, making them integral in the fabrication of complex electronic components and thin-film coatings for various industrial applications.
