Research Summary

A plate-fin total heat exchanger is an energy recovery device designed to efficiently transfer both heat and moisture between two air streams, typically in ventilation or air conditioning systems. It consists of a series of thin, corrugated metal or polymer plates and fins that create parallel channels for the airflows to pass through without mixing. This design enables the exchange of sensible heat (temperature) and latent heat (humidity) by utilizing the thermal and moisture gradients between the incoming and outgoing air streams. Plate-fin total heat exchangers are commonly used in HVAC systems to improve energy efficiency, reduce heating and cooling loads, and maintain indoor air quality by preconditioning fresh air. Their compact structure, high efficiency, and low maintenance requirements make them ideal for commercial, residential, and industrial applications.
