Research Summary

Platinum ingots are refined and solidified bars of pure platinum, a rare and precious metal known for its lustrous appearance, corrosion resistance, and high melting point. Platinum ingots are typically produced through a complex refining and smelting process that involves extracting platinum from ore deposits or recycling platinum-containing materials. The resulting ingots are characterized by their dense, malleable, and ductile nature, making them suitable for various industrial applications, particularly in the production of high-quality jewelry, catalytic converters for automobiles, and certain electronic components. Platinum's unique physical and chemical properties, coupled with its scarcity, contribute to its status as a valuable and sought-after material in both luxury and technological sectors. The ingots may undergo further processing, such as rolling or extrusion, to achieve specific shapes or dimensions based on the intended use in diverse industries.

The major global manufacturers of Platinum Ingots include Anglo American Platinum (ANGPY), Impala Platinum, SBYSF, Northam Platinum, Nornickel, Heraeus, American
