Research Summary

Platinum and palladium carbon catalysts are composite materials where platinum and/or palladium nanoparticles are dispersed on a carbon support structure. These catalysts are widely used in various chemical and industrial processes, including catalytic converters in automotive exhaust systems, fuel cells, and organic synthesis reactions. The high surface area and excellent catalytic properties of platinum and palladium nanoparticles, combined with the conductive and structurally supportive nature of the carbon matrix, make these catalysts highly effective in promoting chemical reactions. In catalytic converters, for example, they facilitate the conversion of harmful gases into less toxic compounds. The unique properties of platinum and palladium, such as their ability to facilitate oxidation-reduction reactions, make them valuable in numerous applications where controlled and efficient catalysis is essential for chemical transformations and emissions control.

The major global manufacturers of Platinum and Palladium Carbon Catalyst include
