Research Summary

A Polarizing Beam Splitter (PBS) is an optical device that divides an incoming beam of light into two separate beams with orthogonal polarization states, typically linear polarization. It consists of a beam splitter coating that reflects light with one polarization while transmitting light with the orthogonal polarization. In a common design, a PBS consists of a cube or plate made of birefringent material with a thin film coating, such as a multilayer dielectric coating. Polarizing beam splitters are widely used in various optical systems, including interferometers, microscopes, and imaging systems, where it is essential to separate and manipulate light based on its polarization. They play a crucial role in optimizing optical setups and ensuring the efficient use of polarized light for specific applications in science, engineering, and imaging technology.

The major global manufacturers of Polarizing Beam Splitters (PBS) include Edmund Optics, Thorlabs, NITTO OPTICAL, Newport Corporation, SIGMAKOKI, CVI Laser, SOC Showa Optronics, Moxtek, Inc., Optics Balzers, Lambda, Keysight Technologies, Meadowlark Optics, Gooch & Housego, CASTECH, Inc., Dayoptics, Inc., EKSMA
