### Research Summary

Polishing powder is an abrasive substance used in various industries, particularly in materials processing and surface finishing applications. Composed of fine particles, often minerals like alumina or silica, polishing powder is employed to achieve a smooth and polished surface on a wide range of materials, including metals, ceramics, glass, and semiconductors. During the polishing process, the powder is typically mixed with a carrier fluid or applied to a polishing pad, creating a slurry that aids in the removal of surface imperfections, scratches, or uneven layers. The abrasive nature of the powder allows for precise material removal, contributing to the enhancement of surface quality and the achievement of specific tolerances in the final product. Polishing powder is extensively used in industries such as metalworking, optics, and semiconductor manufacturing, where achieving a high level of surface finish is crucial for the functionality and performance of the end product.

The major global manufacturers of Polishing Powder include Solvay, Universal Photonics, Showa Chemical, AMG, RCMPA, Northern Rare Earth Group, Huaming
