Research Summary

Poloxamer is a class of non-ionic surfactant compounds that belong to the polyoxyethylene-polyoxypropylene block copolymer family. These synthetic copolymers consist of hydrophilic polyethylene oxide (PEO) and hydrophobic polypropylene oxide (PPO) blocks. Poloxamers are known for their unique amphiphilic properties, allowing them to function as emulsifiers, solubilizers, and stabilizers in various pharmaceutical, cosmetic, and industrial applications. Due to their ability to form micelles, which are colloidal structures in aqueous solutions, poloxamers can improve the solubility of poorly soluble drugs, aid in drug delivery systems, and act as emulsion stabilizers. Additionally, their biocompatibility and low toxicity make them suitable for use in medical formulations. Poloxamers are versatile compounds, and their applications extend to areas such as ophthalmic solutions, injectable formulations, and topical preparations due to their ability to modify the rheological and surface properties of diverse formulations.

The major global manufacturers of Poloxamer include Banana Republic, Ralph Lauren
