Research Summary

Polybutene is a synthetic polymer belonging to the class of polyolefins, specifically polyolefin oligomers. It is produced through the polymerization of butene, a linear alpha-olefin. Polybutene is characterized by its high molecular weight and low degree of crystallinity, contributing to its unique combination of properties. It exists in different grades, typically classified as either high molecular weight polybutene (HMPB) or low molecular weight polybutene (LMPB), each with distinct characteristics. Polybutene is commonly used in various applications, including the production of lubricants, adhesives, sealants, and flexible packaging materials. Its low reactivity, good thermal stability, and excellent viscosity-temperature behavior make it valuable in formulating lubricating oils and hydraulic fluids. In the adhesive and sealant industry, polybutene is utilized for its tackiness and adhesive properties. Its versatility in different industrial sectors is attributed to its range of molecular weights and the ability to tailor its properties for specific applications.

The major global manufacturers of Polybutene include BASF, INEOS, LyondellBasell,

etc. The global players competition landscape in this report is divided into three tiers. The first tier comprises global leading enterprises that command a substantial market share, hold a dominant industry position, possess strong competitiveness and influence, and generate significant revenue. The second tier includes companies with a notable market presence and reputation; these firms actively follow industry leaders in product, service, or technological innovation and maintain a moderate revenue scale. The third tier consists of smaller companies with limited market share and lower brand recognition, primarily focused on local markets and generating comparatively lower revenue.
