Research Summary

Polycarbodiimides are polymers that contain carbodiimide functional groups (-N=C=N-) in their molecular structure. These functional groups are formed through the reaction of isocyanates with urea or other carbodiimide-forming compounds. Polycarbodiimides play a crucial role in the field of polyurethane chemistry, where they are often used as chain extenders or crosslinking agents. The carbodiimide groups facilitate the formation of crosslinks between polymer chains, contributing to the enhancement of mechanical properties and stability of polyurethane materials. These polymers are valued for their ability to improve the durability, chemical resistance, and heat stability of polyurethane products, making them suitable for applications in coatings, adhesives, sealants, and elastomers. The unique reactivity of polycarbodiimides in polyurethane formulations contributes to the tailoring of material properties for specific industrial requirements.

The major global manufacturers of Polycarbodiimides include Angus Chemical, BASF, Stahl, Nisshinbo, DSM, LANXESS, Covestro, etc. The global players competition landscape in this report is divided into three tiers. The first tier comprises global leading

enterprises that command a substantial market share, hold a dominant industry position, possess strong competitiveness and influence, and generate significant revenue.
