Research Summary

Polycarbosilanes refer to a class of organosilicon compounds featuring silicon and carbon atoms in their molecular structure. These polymers are typically synthesized through the polymerization of organosilicon monomers, and they often contain alternating silicon and carbon atoms. Polycarbosilanes exhibit high thermal stability, making them valuable in applications requiring resistance to extreme temperatures. They are employed in the production of ceramic materials and as precursors for silicon carbide, a ceramic material known for its excellent mechanical and thermal properties. Polycarbosilanes can undergo pyrolysis or heat treatment processes to convert them into silicon carbide ceramics, which find applications in advanced materials, coatings, and high-temperature engineering components. The unique combination of silicon and carbon elements in polycarbosilanes contributes to their versatility in materials science and engineering applications, especially in the development of high-performance ceramics.

The major global manufacturers of Polycarbosilanes include UBE Corporation, Starfire
