Research Summary

Polyethyleneimine (PEI) is a synthetic polymer with a repeating unit derived from the polymerization of ethyleneimine monomers. It is a highly branched and cationic polymer, known for its versatile chemical properties. PEI has applications in various fields, including as a flocculant in water treatment, a gene transfection agent in molecular biology, and a stabilizer in colloidal systems. Its cationic nature allows it to interact with negatively charged surfaces, making it useful in adhesion promotion and surface modification processes. PEI is valued for its high reactivity, biocompatibility, and ability to form complexes with nucleic acids, proteins, and other biomolecules. These properties make PEI a valuable tool in research, medical, and industrial applications, showcasing its adaptability in diverse scientific and technological endeavors.
