Research Summary

Polymethylsilsesquioxane (PMSQ) is a type of hybrid organic-inorganic polymer that belongs to the family of silsesquioxanes. Silsesquioxanes consist of silicon (Si), oxygen (O), and organic groups. In the case of polymethylsilsesquioxane, the organic groups are methyl (CH₃) units. PMSQ is characterized by a three-dimensional cage-like structure, where each silicon atom is bonded to three oxygen atoms and one methyl group. This unique structure imparts desirable properties such as thermal stability, chemical resistance, and film-forming capabilities. PMSQ is widely used in the cosmetics and personal care industry as a film-forming agent in products like skin care formulations and hair care products. It provides a smooth and even film on the skin or hair, contributing to product performance and aesthetics. Additionally, PMSQ is utilized in various industrial applications for coatings, adhesives, and as a surface modification agent due to its advantageous properties.

The major global manufacturers of Polymethylsilsesquioxane include Wacker, EastHill, Grant Industries, ABC Nanotech, Shin-Etsu, The Innovation Company, Momentive
