Research Summary

Polyvinyl Alcohol (PVA) has found applications in the medical field due to its biocompatibility, water solubility, and film-forming properties. PVA is used to produce films, coatings, and hydrogels that are employed in various medical and pharmaceutical applications. For instance, PVA films can be used for the packaging of pharmaceutical products and as a component in wound dressings and medical patches. PVA hydrogels have been explored for drug delivery systems, wound healing, and tissue engineering applications due to their ability to absorb and release water, mimicking some characteristics of biological tissues. Furthermore, PVA has been investigated for the development of temporary scaffolds in regenerative medicine. Its non-toxic nature and ability to dissolve in water without leaving harmful residues make PVA a versatile material for medical applications, contributing to advancements in drug delivery and tissue engineering.
