Research Summary

Porous carbon refers to a type of carbon material characterized by its high degree of internal porosity or empty spaces within its structure. This porosity is often in the form of pores or cavities that can range in size from nanometers to micrometers. The presence of these pores enhances the surface area of porous carbon, making it suitable for various applications such as adsorption, gas storage, and catalysis. Different methods, including the carbonization of organic precursors or the activation of carbonized materials, can be employed to produce porous carbon with specific characteristics tailored for intended uses. Activated carbon, carbon aerogels, and carbon foams are examples of porous carbon materials widely utilized in environmental purification, energy storage, and diverse industrial processes due to their unique structural properties and adsorption capabilities.

The major global manufacturers of Porous Carbon include Kuraray, Osaka Gas Chemicals, Fujian Yuanli, Norit, Ingevity, Haycarb, Jinding Activated Carbon, Ningxia Coal, Advanced Emissions Solutions, Fujian Xinsen Carbon, MuLinSen Activated
