### Research Summary

Portable and wearable dialysis devices are innovative medical technologies designed to provide greater flexibility and independence to individuals undergoing dialysis treatment for kidney failure. Unlike traditional in-center hemodialysis, which requires patients to visit a medical facility several times a week, portable and wearable dialysis devices aim to allow patients to receive treatment in the comfort of their homes or while going about their daily activities. These devices are compact, lightweight, and often equipped with user-friendly interfaces. Wearable dialysis devices are designed to be worn on the body, offering a more continuous and less disruptive form of treatment. The portability of these devices not only enhances the quality of life for patients but also potentially improves treatment adherence and outcomes by providing more frequent and personalized dialysis sessions. These technologies represent a significant advancement in renal care, offering a more patient-centric approach to managing chronic kidney disease.
