Research Summary

Positron Emission Tomography (PET) scanners are advanced medical imaging devices used to visualize and assess the metabolic and functional activity within the body. PET scanners detect positron-emitting radiotracers, which are injected into the patient's body and accumulate in areas with high metabolic activity, such as tumors. The positron-electron annihilation process produces gamma rays that are detected by the PET scanner, enabling the creation of detailed three-dimensional images. PET scans are widely used in oncology to identify and stage cancers, assess treatment response, and monitor disease progression. They are also utilized in cardiology, neurology, and other medical fields to evaluate organ function and detect abnormalities at a molecular level. PET imaging is often combined with computed tomography (CT) or magnetic resonance imaging (MRI) for more comprehensive diagnostic information.

The major global manufacturers of Positron Emission Tomography (PET) Scanners include GE Healthcare, Siemens Healthineers, Koninklijke Philips, Toshiba Corporation,
