Research Summary

A post-etch residue cleaner is a chemical solution used in semiconductor manufacturing to remove residues and contaminants left on the wafer surface after the etching process. During the etching step, various materials are selectively removed from the semiconductor wafer to create patterns and features. However, this process can leave behind unwanted residues, such as etching by-products or chemicals used in the etching process. Post-etch residue cleaners are specifically formulated to effectively and selectively remove these residues without harming the underlying structures on the wafer. The cleanliness of the wafer surface is crucial for the subsequent steps in semiconductor fabrication, ensuring the reliability and functionality of the integrated circuits. Post-etch residue cleaners play a vital role in maintaining the quality of semiconductor devices by providing a clean surface for subsequent processing steps.
