Research Summary

A post-tensioning system is a construction technique used to reinforce and strengthen concrete structures by introducing compressive forces into the concrete through the tensioning of high-strength steel tendons or cables. This process involves casting the concrete with ducts or sleeves to accommodate the tendons. After the concrete has cured to a certain strength, the tendons are threaded through the ducts, and tension is applied using hydraulic jacks. Once the desired level of tension is achieved, the tendons are anchored to the structure. This technique allows for better control over the performance of the structure, minimizing cracking and enhancing its load-carrying capacity. Post-tensioning is commonly employed in the construction of bridges, parking structures, slabs, and other large concrete elements where the ability to control deflections and optimize structural efficiency is crucial.

The major global manufacturers of Post-Tensioning System include VSL, Freyssinet, DSI, Suncoast Post-Tension, BBV, SRG, Amsysco, Tendon Systems, TMG Global, OVM Machinery, VLM, Kaifeng Tianli, AYM, QMV, Traffic Prestressed, etc. The global
