### Research Summary

Potassium gold cyanide, with the chemical formula  $\text{KAu}(\text{CN})_2$ , is a highly toxic and water-soluble coordination compound used in the electroplating of gold onto metallic surfaces. It is a key component in the gold electroplating process, where a thin layer of gold is deposited onto jewelry, electronic components, and other items. Potassium gold cyanide is produced by the reaction of gold with cyanide in the presence of potassium ions. The resulting compound serves as a stable source of gold for electroplating baths, ensuring uniform and high-quality gold coatings. Due to its toxicity and handling hazards, strict safety measures and adherence to regulatory guidelines are essential in the production and use of potassium gold cyanide in industrial processes.
