Research Summary

A poultry house temperature and humidity control system is a specialized environmental control system designed to maintain optimal conditions inside poultry houses for the health and productivity of poultry. These systems typically consist of sensors, controllers, heaters, fans, and misters or foggers. The sensors monitor temperature and humidity levels inside the poultry house, while the controllers adjust the operation of heating, cooling, and ventilation equipment to maintain preset conditions. In cold weather, heaters are activated to maintain a comfortable temperature, while in hot weather, fans and misters are used to cool the environment. Proper temperature and humidity control are crucial for preventing heat stress, respiratory issues, and other health problems in poultry, as well as ensuring optimal growth and egg production. These systems also help to manage air quality and reduce the risk of diseases, ultimately contributing to the overall welfare and profitability of poultry farming operations.
