### Research Summary

Powder metallurgy components are engineered products manufactured through the powder metallurgy (PM) process, which involves transforming powdered metal or metal alloy materials into finished parts. The process typically includes powder production, mixing, compaction, and sintering. Metal powders, often created through techniques like atomization or mechanical comminution, are mixed with other powdered materials to achieve the desired composition and properties. The mixture is then compacted into the desired shape using dies, and the compact undergoes sintering, where the metal particles fuse to form a solid component. Powder metallurgy components offer advantages such as enhanced material utilization, complex shapes, and the ability to achieve specific mechanical and physical properties. They find applications across various industries, including automotive, aerospace, medical, and consumer goods, where their versatility, cost-effectiveness, and precise manufacturing capabilities contribute to the production of durable and high-performance parts.

The major global suppliers of Powder Metallurgy Components include GKN, Sumitomo

Electric Industries, Hitachi Chemical, Fine Sinter, Porite, Miba, PMG Holding, AAM, Hoganas, AMETEK Specialty Metal Products, Allegheny Technologies Incorporated, Burgess-Norton, Carpenter Technology, Diamet, NBTM New Materials Group, Jiangsu Eagle-Globe Group, Minxin New Material, Shanghai Automotive Powder Metallurgy, etc. The global players competition landscape in this report is divided into three tiers.
