Research Summary

Power electronic DCB (Direct Copper Bonded) and AMB (Active Metal Brazed) substrates are advanced materials used in the manufacturing of power electronic devices, such as inverters, converters, and motor drives. DCB substrates consist of a ceramic dielectric layer, typically alumina, bonded to a copper layer through a direct bonding process, creating a robust and thermally conductive platform that facilitates efficient heat dissipation. AMB substrates, on the other hand, utilize a brazing process to bond copper to a ceramic base, providing similar thermal management benefits while allowing for complex geometries and enhanced mechanical stability. Both DCB and AMB substrates are critical for high-power applications, as they support the effective operation of power electronic components by improving thermal performance, electrical insulation, and mechanical reliability. These substrates are increasingly utilized in electric vehicles, renewable energy systems, and industrial automation, where efficient power conversion and management are essential.
