Research Summary

Power factor correction devices are electrical components or systems designed to improve the power factor in electrical systems. The power factor is a measure of how effectively electrical power is being converted into useful work output. A low power factor can result in inefficient energy use and increased energy costs. Power factor correction devices work by adjusting the electrical characteristics of the system, typically by introducing capacitors to offset inductive loads and reduce reactive power. This correction helps to bring the power factor closer to unity (1.0), indicating a more efficient use of electrical power. Power factor correction is particularly relevant in industrial and commercial settings where large motors, transformers, and other inductive loads are common, as it can lead to energy savings, reduced electricity costs, and improved overall electrical system efficiency.

The major global suppliers of Power Factor Correction Devices include ABB, Schneider, Siemens, Eaton, GE Grid Solutions, NISSIN ELECTRIC, Xian XD Power, Hubbell, Guilin Power Capacitor, Herong Electric, Shizuki Electric, Sieyuan Electric, Ducati
