### Research Summary

A Powered Air Purifying Respirator (PAPR) is a respiratory protection device that uses a motorized fan to draw ambient air through filters and deliver a continuous flow of purified air to the wearer's breathing zone. PAPRs are designed to provide a higher level of respiratory protection compared to traditional filtering facepiece respirators. They consist of a headpiece or hood, a motorized fan unit, and filters that capture airborne particles. PAPRs are commonly used in various industries where there is a need to protect against particulate contaminants, toxic dust, fumes, and aerosols. The positive pressure created by the fan helps ensure a constant supply of clean air, reducing the breathing effort for the wearer. PAPRs find applications in healthcare, pharmaceuticals, manufacturing, and other environments where respiratory protection is crucial, and comfort and extended use are essential considerations.
