Research Summary

Precious metal sputtering targets are specialized materials used in the thin film deposition technique known as sputtering. Comprising metals like gold, silver, platinum, and palladium, these targets are employed in a process where high-energy ions are directed at the target surface, causing atoms or molecules to be ejected. These ejected particles then deposit onto a substrate, forming a thin film with desirable properties such as high electrical conductivity, chemical stability, and often unique optical characteristics. Precious metal sputtering targets find widespread applications in electronics, optics, medical devices, and catalysis, capitalizing on the specific qualities of each metal to meet the demands of various technological and scientific fields. The choice of a particular precious metal depends on the desired properties of the thin film and the specific requirements of the application at hand.

The major global manufacturers of Precious Metal Sputtering Targets include AngloAmerican, Newmont Corporation, Barrick, NORNICKEL, Sibanye Gold, AngloGold Ashanti, China National Gold Group, Polyus Gold International, Newcrest Mining
