Research Summary

A preclinical tomography system is an advanced imaging technology specifically designed for conducting high-resolution, three-dimensional imaging in preclinical research settings. This system utilizes various imaging modalities such as positron emission tomography (PET), single-photon emission computed tomography (SPECT), computed tomography (CT), and magnetic resonance imaging (MRI). These systems are used in preclinical studies involving small animals, enabling researchers to visualize and analyze anatomical structures, physiological processes, and molecular events in vivo. The detailed imaging provided by preclinical tomography systems is instrumental in advancing research in areas like oncology, neuroscience, cardiology, and drug development, allowing scientists to non-invasively study disease models, track the distribution of radiotracers, and assess treatment responses at a preclinical stage before translating findings to clinical applications.

The major global manufacturers of Preclinical Tomography System include Bruker, MR Solutions, Scanco Medical, PerkinElmer, Trifoil Imaging, Mediso, Sedecal, MILabs, etc.
