Research Summary

Presbyopia correction devices are specialized optical tools designed to address presbyopia, a common age-related condition that affects near vision. Presbyopia occurs as the eye's natural lens loses flexibility, making it challenging to focus on close objects. Correction devices aim to compensate for this loss of accommodation. Common presbyopia correction devices include reading glasses, which provide magnification for close-up tasks, and multifocal lenses, which have different prescription strengths for various distances. Progressive addition lenses (PALs) are another type, featuring a gradual transition from distance to near vision. Contact lenses designed for presbyopia, known as multifocal or bifocal contacts, are also available. Surgical options such as monovision LASIK or intraocular lenses (IOLs) are advanced interventions for presbyopia. The choice of presbyopia correction device depends on factors like individual preferences, lifestyle, and the extent of visual correction needed for daily activities.

The major global manufacturers of Presbyopia Correction Devices include AcuFocus,

Refocus, Presbia, etc. The global players competition landscape in this report is divided into three tiers.
