Research Summary

A pressure bandage is a medical dressing designed to provide compression and support to a wound or injury. Typically used to control bleeding and minimize swelling, pressure bandages are constructed with an elastic or stretchable material that allows for a snug fit around the injured area. The applied pressure helps to constrict blood vessels, reducing blood flow and preventing excessive bleeding. Pressure bandages are commonly used in first aid scenarios for injuries such as cuts, lacerations, or wounds with significant bleeding. The bandage may incorporate additional features, such as sterile padding, to promote wound healing and protect the injured area. The application of a pressure bandage is a standard practice in emergency medical care to stabilize and manage various types of injuries effectively.
