Research Summary

Pressure indicating film is a thin, flexible material that changes color in response to applied pressure. It is commonly used in various industries to measure and visualize pressure distribution between two surfaces. Pressure indicating film typically consists of multiple layers, including a polyester film base coated with microcapsules containing a color-forming material and a developer. When pressure is applied to the film, the microcapsules rupture, releasing the color-forming material, which reacts with the developer to produce a visible color change. The intensity of the color change corresponds to the amount of pressure applied, allowing users to quickly and easily assess pressure distribution and identify high-pressure areas or irregularities. Pressure indicating film is used in applications such as automotive manufacturing (for checking gasket sealing, clutch engagement, and brake pad uniformity), electronics assembly (for ensuring even pressure during bonding or laminating processes), and medical applications (for assessing contact pressure in orthopedic devices or prosthetics). It provides a cost-effective and efficient solution for quality control, process optimization, and troubleshooting in various industrial and research settings.

The major global manufacturers of Pressure Indicating Film include Fujifilm, Sensor Products Inc, Kumlong International, Lucky Innovative, Shanghai SOCO, HMD, JKMTS, RoadGreen, etc. The global players competition landscape in this report is divided into three tiers.
