Research Summary

A pressure-reducing (boost) valve is a mechanical device used in fluid systems to regulate and control the pressure of the fluid flowing through a pipeline. This valve is designed to reduce or boost the pressure as needed, ensuring that it remains within a specified range. In certain applications, it may be referred to as a pressure-boosting valve when its function is to increase the pressure. Pressure-reducing valves are commonly employed in water supply systems, irrigation, and industrial processes to maintain a consistent and safe pressure level downstream. They work by automatically adjusting the valve opening to control the flow and balance the pressure, preventing excessive pressure that could damage pipes, fixtures, or equipment. These valves are crucial for optimizing system performance, conserving water, and protecting downstream components from potential damage caused by high pressure.

The major global manufacturers of Pressure-reducing (Boost) Valve include Pentair, Curtiss-Wright, GE Mooney, Elster, Emerson, Weir Group, Festo, Valvitalia, Kosmek, Parker, Wuzhong Instrument, Watts, Eaton, SMC, Armstrong International, Goetze,
