Research Summary

A pressure transmitter is a device used to measure and convert the pressure of a fluid or gas into an electrical signal that can be monitored, recorded, or controlled by a system. It typically consists of a pressure sensor, which detects the pressure of the medium, and a transmitter that converts the sensor's output into a standardized signal, such as 4-20 mA or a digital communication protocol like HART or Modbus. Pressure transmitters are widely used in industries such as oil and gas, chemical processing, water treatment, and manufacturing for applications like process control, leak detection, and equipment monitoring. They can be designed for a range of pressure levels, from low to high, and are often built to withstand harsh environmental conditions, including extreme temperatures, corrosive substances, and high-vibration settings. The accurate and reliable measurement of pressure is critical for ensuring the safety, efficiency, and stability of industrial systems.

The major global manufacturers of Pressure Transmitter include Emerson(Rosemount), Yokogawa, Honeywell, E+H, Schneider(Foxboro), ABB, Siemens, SMAR, Azbil
