### Research Summary

A programmable power supply is an electronic device designed to provide variable and controllable electrical power to electronic circuits and devices. Unlike fixed power supplies, programmable power supplies allow users to set specific voltage and current levels dynamically. These power supplies are often used in research and development, testing, and prototyping applications where precise control over the power source is required. Programmable power supplies can be adjusted remotely or through built-in controls to provide different voltage and current outputs, making them versatile for testing and validating electronic components, circuits, and systems under various operating conditions. They are equipped with digital interfaces, such as USB, Ethernet, or GPIB, enabling users to program and control the power supply parameters, automate testing procedures, and integrate them into larger test systems or production setups.

The major global manufacturers of Programmable Power Supply include AMETEK Programmable Power, TDK-Lambda, Tektronix, Chroma ATE, Keysight Technologies, National Instruments Corporation, Magna-Power Electronics, B&K Precision, XP Power,
