### Research Summary

Proton Pump Inhibitors (PPIs) are a class of medications commonly used to treat conditions related to excessive stomach acid production. These drugs work by inhibiting the activity of the proton pump, a gastric enzyme responsible for the final step in the production of stomach acid. By blocking this enzyme, PPIs effectively reduce the secretion of stomach acid into the digestive system. This makes PPIs effective in treating conditions such as gastroesophageal reflux disease (GERD), peptic ulcers, and Zollinger-Ellison syndrome. Examples of PPIs include omeprazole, lansoprazole, and esomeprazole. PPIs are often prescribed for short-term relief of symptoms or for more extended periods to manage chronic conditions. While they are generally well-tolerated, long-term use may be associated with certain risks, and it is essential for individuals to use PPIs under the guidance of a healthcare professional who can monitor their use and evaluate potential side effects.

The major global manufacturers of Proton Pump Inhibitors include Takeda, Pfizer, AstraZeneca, Bayer, Sun Pharma, Teva, Eisai Co., Mylan, AOSAIKANG Pharma,
